

Problem Statement: AdmissionGPT

Choosing the right college and course is a challenging process for students and parents due to scattered information about colleges, admission criteria, cutoffs, fees, rankings, placements, and eligibility requirements. Students often find it difficult to compare colleges, analyze previous year admission trends, and make decisions according to their academic performance, interests, budget, and career goals.

The objective is to build an AI-powered Admission Agent that provides personalized college recommendations and admission guidance. The system retrieves reliable admission data such as rankings, accreditation, eligibility criteria, opening and closing ranks, category-wise cutoffs, state quota details, fees, hostel information, and placement records. It helps students shortlist suitable colleges, compare options, estimate admission chances, and receive guidance throughout the admission process.

The solution uses a multi-agent approach including an Admission Knowledge Agent for collecting college data, a College Recommendation Agent for suggesting suitable colleges and branches, an Admission Advisory Agent for counseling and application support, and a College Comparison Agent for decision-making. A visualization dashboard displays college comparisons, cutoff trends, admission probability, deadlines, and student progress to make the admission journey easier and more informed.
